1 INTRODUCTION

The main objective is to define the structure for the input of the underlier following the number of rules that allows user to identify the Asset Class, Underlying Structure, Underlier Type and Underlier ID Source if these are necessary. The solution will vary depending upon the specific requirement for each product. The structure outlines the following rules that allows user to construct their product definitions and to input the correct details following the logical pattern.

1.1 Asset Class Selection

- Asset Class selection is designed particularly for products with multi-assets.
- It allows user to define the underlying asset classes to align with ISO 4914 (UPI) requirement to identify the asset classes involved.
- Sample UPI product definition template is Other Swap (multi-asset) where user is allowed to select the underlying asset classes.
- In some cases where asset class is already defined in the template e.g., Fixed floating rates, the selection will not be required for users. The asset class selection is specifically for “Other” asset class where multi-asset products are applicable and can be defined by users.

1.2 Underlying Structure Selection

- Underlying Structure selection allows user to identify whether the product has a single underlier (e.g.: an Equity, a Debt Instrument etc.) or multiple underliers (i.e., Basket).
- To align with ISO 4914 (UPI) requirement, user is not required to identify the individual constituent identifiers if the OTC derivative has more than one underliers (i.e., Basket).
- Sample UPI product definition template is Non-standard Equity where user can select a Single Underlier or a Basket as an underlying structure.
- In a number of cases, the product can only accept a single underlier (e.g.: Debt Option). In other cases, the product is always based on a Basket (e.g.: Portfolio Swap). In both of these cases, the underlier structure is known and so the user is not required to make a choice.
- The underlying structure is based on the input of the user in the request message whether the underlier has single or multiple underliers. The record then will derive the input of the user into underlier characteristic whether the underlying is a “Single” or a “Basket” of underliers.

1.3 Underlier Type Selection

- Underlier Type selection allows user to select the underlying asset type whether it is a Security, Legal Entity, Index, Prop Index, etc.
- The method is being supported by the Underlier ID and Underlier ID Source that will indicate the origin of the underlier.
- Sample UPI product definition template is Corporate CDS where user can select a Fixed Income Security or Legal Entity as an underlier type. The Underlier Type selection does not apply to all product (e.g., Fixed floating rates) as there are templates in which single underlier type exist and so the attribute selection is not required.

1.4 Underlier ID Source Selection

- Underlier ID Source selection allows user to select the origin or publisher of the associated underlier ID depending on the nature of the underliers on which the product is based and will support a selection of its source.
- Sample UPI product definition template is Debt Option where user is allowed to select a Fixed Income Security using ISIN, RIC, FIGI, CUSIP and SEDOL as an underlier ID source. The following section takes each underlier selection and provides details of the choices available to the user (if required by the product) and the way in which each choice impacts the definition of the product.

1.5 Return Underlier ID Source Selection

- Return Underlier ID Source selection allows user to select the Underlier ID Source values i.e., ISIN, RIC, FIGI, CUSIP and SEDOL, that they wish to receive in the returned UPI record message.
- The system will return the specified Underlier ID as part of the UPI record if it is mapped to the Primary ID (ISIN). If no mapping exists, the system will return the relevant attribute with no value.
- Applicable for product templates which support the input of Alternate Underlier Identifiers, i.e., RIC, FIGI, CUSIP and SEDOL.
- Sample UP product definition template is Equity Option Single Name where user can define the Return Underlier ID Source values i.e., ISIN, RIC, FIGI, CUSIP and SEDOL.

2 ASSET CLASS SELECTION

- Underlying Asset Class Selection in the product definition template supports a product with multiple asset classes (i.e., Rates, Credit, Equity, Foreign Exchange & Commodities) as shown in Illustration 1.
- User is allowed to identify and select the underlying asset class of a certain product. Once user has selected the underlying asset classes (as shown in Illustration 1), relevant attributes for each asset class will be made available as shown in Illustration 3 below.
- If a given product does not require a selection of multiple asset classes, (i.e., single asset class only), then Asset Class Selection will not be included in the UPI product definition template and the GUI.

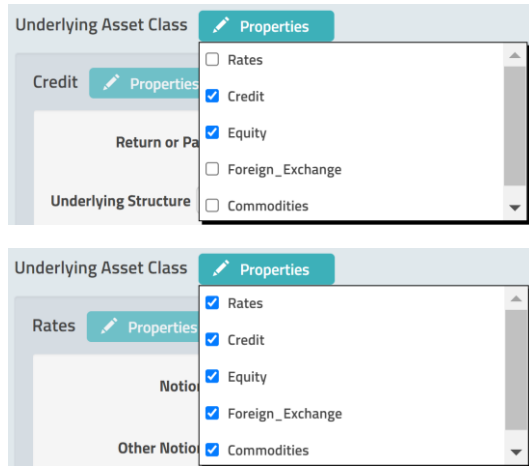

2.1 Single Asset Class Selection

Illustration 1: Below illustrate where user must select at least one underlying asset class and cannot have zero asset classes.

2.2 Multiple Asset Class Selection

Illustration 2: Below illustrate where user selects multiple asset class or all asset classes.

2.3 Associated Attributes for Asset Class Selection

Illustration 3: Below illustrates the attributes associated to its asset class (e.g., Equity and Credit) and will be made available based on Underlying Asset Class selected.

Return or Payout Trigger

Underlying Structure

3 UNDERLYING STRUCTURE SELECTION

The Underlying structure selection allows user to select whether the underlying is a single underlier or basket based on its product. In line with this, the specification of ISO 4914 (UPI) document dictates that the constituent underlying identifiers and their sources are not required if underlying is a custom of basket.

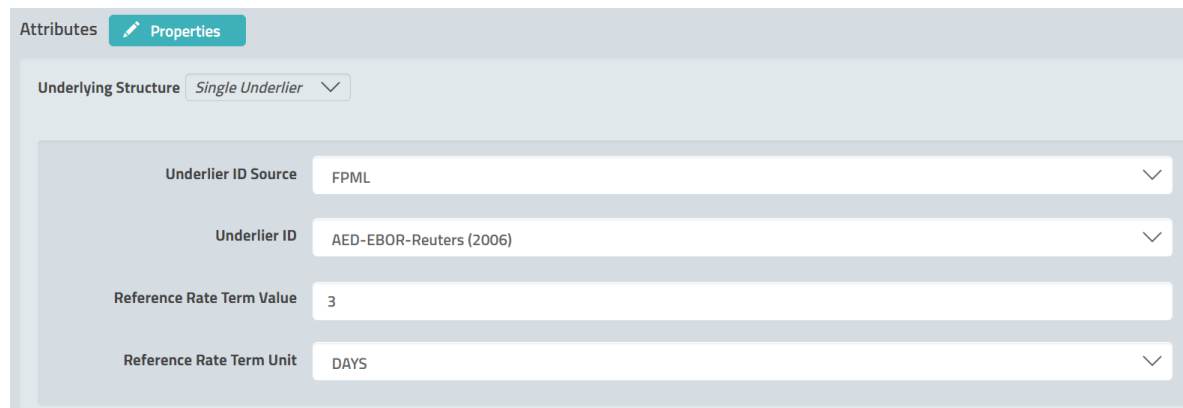

3.1 Single or Multiple Underliers

For product that supports both, user is asked to select whether underlying is a single or multiple underliers (i.e., Basket).

If the selection is a single underlier, user needs to enter the identifier of the underlier (e.g., Underlier ID and Underlier ID Source) in the request.

Request

A screenshot of a web application interface showing a form for entering underlier details. The form is titled 'Attributes' and has a 'Properties' button. The 'Underlying Structure' dropdown is set to 'Single Underlier'. Below this, there are four input fields: 'Underlier ID Source' (FPML), 'Underlier ID' (AED-EBOR-Reuters (2006)), 'Reference Rate Term Value' (3), and 'Reference Rate Term Unit' (DAYS). Each field has a dropdown arrow on the right side.

Field	Value
Underlier ID Source	FPML
Underlier ID	AED-EBOR-Reuters (2006)
Reference Rate Term Value	3
Reference Rate Term Unit	DAYS

Then the record will return the underlying details and underlier characteristic of a “Single” in the Attribute section.

Record

Attributes

Underlying

Underlier Characteristic Single

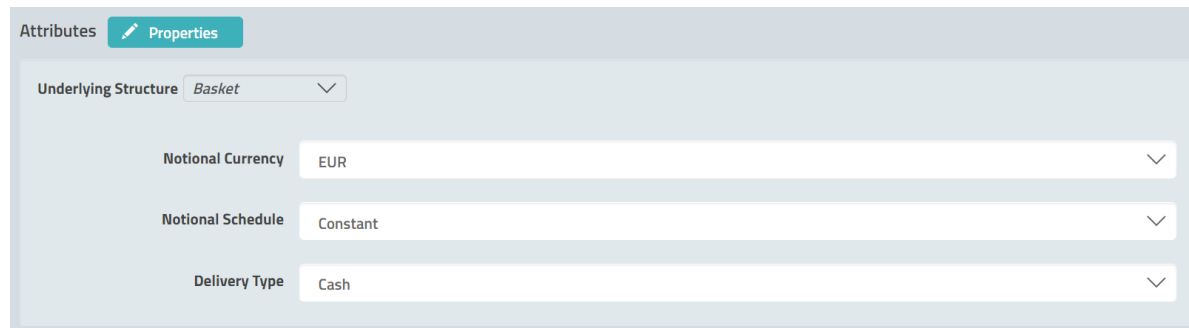

Reference Rate AED-EBOR-Reuters

Reference Rate Term Value 3

Reference Rate Term Unit DAYS

If the selection is a basket, underlier entry is not required and the default value for underlier characteristic in the request message is “Basket”.

Request

Delivery Type Cash ▼

Then the record will return underlier characteristic of a “Basket” in the Attribute section.

Record

Attributes

Underlying

Underlier Characteristic Basket

Notional Currency EUR

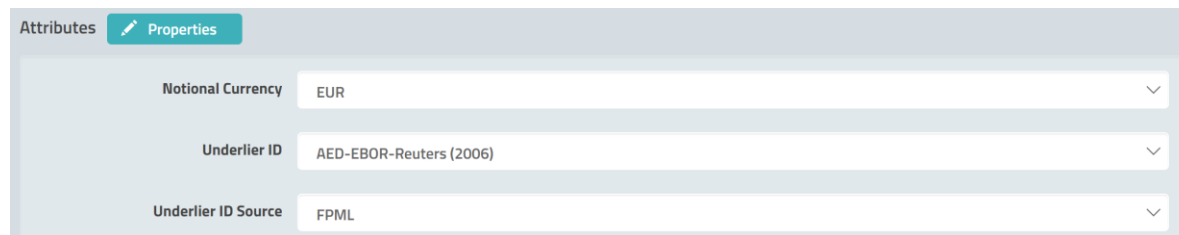

Notional Schedule Constant

Delivery Type CASH

3.2 Single Underlier only

For products that supports single underlier only (e.g., Fixed floating rates), the user is not required to make a selection of the underlier structure but is required to enter the identifier of the underliers and its sources (See Illustration 1). The record section will not return underlier characteristic of the product as it only allows single input of underlier.

Illustration 1: Below illustrates if Underlier Structure is Single Underlier

Attributes **Properties**

Notional Currency EUR

Underlier ID AED-EBOR-Reuters (2006)

Underlier ID Source FPML

3.3 Basket only

In cases where the product supports multiple underliers only (e.g., Multi exotic swap), the user is not required to make a selection or enter the constituent underlying identifiers and its sources, but the UPI record will include an indication that the underlier is a basket (See Illustration 2).

Illustration 2: Below illustrates if Underlier Structure selected is Basket.

Underlier Characteristic	Basket <input type="text"/>

Moreover, the specification for underlying structure selection includes basis style product where other leg underlier has same behavior as the first leg, this includes non-standard product templates even if other leg underlier is an optional field.

4 UNDERLIER TYPE SELECTION

In order to support products that are based on more than one type of underlier, the underlier type selection will allow the user to select the type of underlier for the product. For example: the underlier for a Corporate CDS can be either (a) a Debt Instrument or (b) a Legal Entity. Once the type of underlier is selected, the user will then be able to select the underlier ID source from a list of appropriate identifiers (see next section).

4.1 Single Underlier Type

If a product has one type of underlier, the underlier type selection is not required (see sample below).

The screenshot displays a form with three dropdown menus. The first dropdown, labeled 'Underlying Structure', is set to 'Single Underlier'. The second dropdown, labeled 'Underlier ID', is set to 'AUD-CPI'. The third dropdown, labeled 'Underlier ID Source', is set to 'FPML'. Each dropdown has a small downward arrow on its right side.

4.2 Multiple Underlier Type

If single underlier has been selected as underlying structure (or if the template only supports a single underlier) and product can be based on more than one type of underlier, the underlier type selection will be made available in the request message. The values in the selection list will vary depending on the asset class.

The screenshot displays a multi-level configuration interface for underliers. At the top level, there are tabs for 'Attributes' and 'Properties'. Below this, the 'Underlying Structure' is set to 'Single Underlier'. A second level of configuration is visible, with 'Underlying Asset Type' set to 'Single Name'. The 'Underlier Type' dropdown is open, showing 'Fixed Income Security' as the selected option, with 'Legal Entity' as an alternative. Below the dropdown, the 'Underlier ID Source' is set to 'ISIN', and the 'Underlier ID' field is empty.

If underlying structure is a basket, the underlier type selection is not present in the request template.

The Underlier ID source will vary depending on the nature of the underliers on which product it is based and will support a selection of its sources e.g., for Fixed Income Security type there will be a selection of Underlier ID Source e.g., ISIN, RIC, FIGI, CUSIP, SEDOL and for Underlier type that has one source, the value will have a default Underlier ID Source e.g., Legal Entity – LEI.

4.3 Underlier Type selection for Multiple Asset Class

For product templates with multiple asset class, the underlier type will be defined based on the asset class selected by user and appropriate details must be provided.

- a) User's must select the asset class first, then followed by Underlying Structure.
- b) The Underlying structure will have two selections whether it is a Single underlier or a basket.
- c) If Single underlier has been selected, the underlier type will be present depending on the asset class. For single underlier type, the attribute will not be present and for multiple underlier type, the attribute will have a list of selection.
- d) If the underlier type has a multiple selection, the underlier ID source will vary dependent on the value selected.

Below shows underlier type selection based on the Underlying Asset Class selected.

5 UNDERLIER ID SOURCE SELECTION

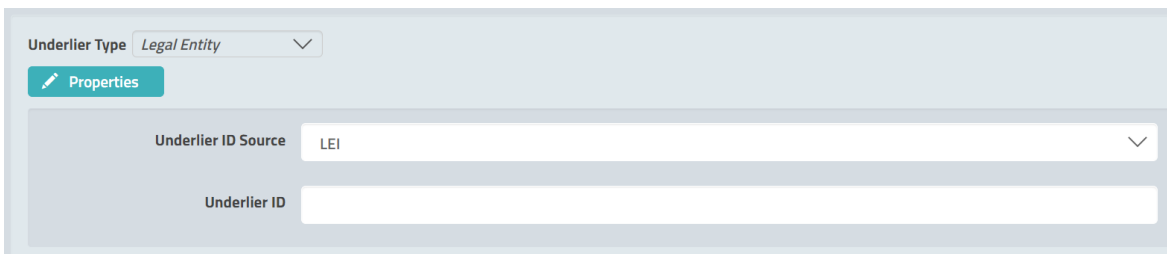

This section discusses the Underlier ID Source enumerations for the corresponding Underlier Type and how the user needs to identify which ID to enter in the product template. This attribute will be available only if a user selects Single Underlier as the Underlying Structure. The system will be designed to support Primary and Alternate Underliers which will be mapped to the Primary. Users can have an option to select the alternate IDs.

For Underlier Type – Security, Alternate Underlier Identifiers are possible where full details can be found in Alternative ID Functional Specification.

5.1 Single Underlier ID Source

Underlier Type with single source will have a default value in the Underlier ID Source field based on its type.

Sample 1: For underlier Type – Legal Entity, only LEI is the supported value.

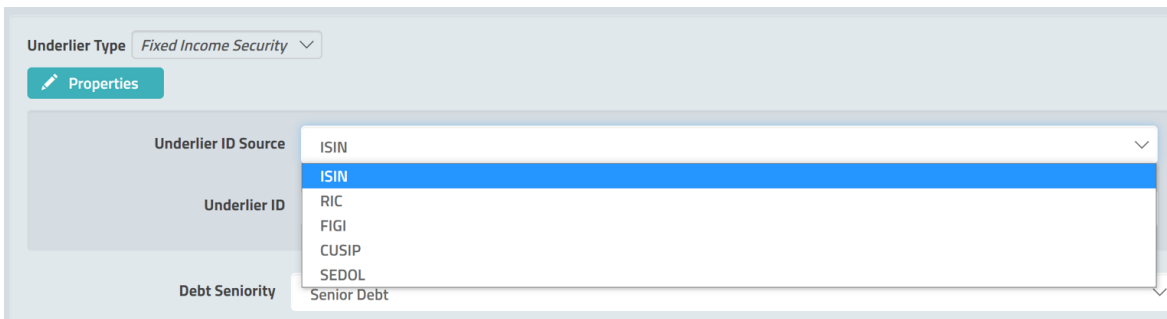

The screenshot shows a user interface for selecting an Underlier ID Source. At the top, there is a dropdown menu for 'Underlier Type' set to 'Legal Entity'. Below it is a green 'Properties' button. The main area contains two input fields: 'Underlier ID Source' with a dropdown menu showing 'LEI' as the selected option, and 'Underlier ID' with an empty text input field.

5.2 Multiple Underlier ID Source

Underlier Type with multiple origins will have a selection of supported sources in the field and underlier ID definition will vary depending on its choice.

Sample 2: If underlier Type is Fixed Income Security, multiple sources are applicable i.e., Primary (ISIN) and Alternate (RIC, FIGI, CUSIP, SEDOL).

The screenshot shows a user interface for selecting an Underlier ID Source. At the top, there is a dropdown menu for 'Underlier Type' set to 'Fixed Income Security'. Below it is a green 'Properties' button. The main area contains three input fields: 'Underlier ID Source' with a dropdown menu showing a list of options (ISIN, RIC, FIGI, CUSIP, SEDOL) and 'ISIN' selected; 'Underlier ID' with an empty text input field; and 'Debt Seniority' with a dropdown menu showing 'Senior Debt' as the selected option.

6 RETURN UNDERLIER ID SOURCE SELECTION

Based on user's permission, Return Underlier ID Source selection allows user to define the Underlier ID Source values, i.e., ISIN, RIC, FIGI, CUSIP, SEDOL that they wish to receive in the returned UPI record. If the user is not permitted for Underlier ID Source e.g., SEDOL, the value in the drop-down menu is greyed-out and cannot be selected. This selection is made available for users when UPI is created, retrieved, or searched.

The system will return the specified Alternate ID as part of the derived section in the UPI record if it is mapped to Primary ID (ISIN). If no mapping exists, the system will return the relevant attribute with no value.

Request

The screenshot shows a web interface for creating or editing a UPI record. At the top, there are tabs for 'ISIN' and 'UPI'. Below the tabs, there are filters for 'Asset Class' (Equity), 'Instrument Type' (Option), 'Product' (Single_Name), and 'Level' (UPI), along with a 'LOAD' button. The main form area is titled 'Request.Equity.Option.Single_Name.UPI' and contains a 'Header' section with dropdowns for 'Asset Class', 'Instrument Type', 'Product', and 'Level'. Below this is an 'Attributes' section with a 'Properties' button and several input fields: 'Underlier ID Source' (set to ISIN), 'Underlier ID' (US92857WBQ24), 'Option Type' (Call), 'Option Exercise Style' (American), 'Valuation Method or Trigger' (Vanilla), and 'Delivery Type' (Cash). A dropdown menu is open for 'Return Underlier ID Source', showing options: ISIN, CUSIP, FIGI, RIC, and SEDOL. The 'Return Underlier ID Source' field is highlighted with an orange box, and the dropdown menu is also highlighted with an orange box. At the bottom right, there are 'CREATE' and 'DISMISS' buttons.

7 EXAMPLE USE CASE

This section will illustrate how the underlier input method will work for certain products. The example workflows will give user a view of how each structure is defined based on the selection and will vary depending on the product template.

7.1 Underlying Asset Class

The underlying asset class is applicable for multi-asset product that will allow users to choose one or more asset class depending on the nature of their request. The associated attributes will vary depending on the underlying asset class selected.

In the sample below for Other non-standard templates, if two asset classes e.g., Rates and Foreign Exchange are required, user must click on the properties to have the list of asset classes and tick the desired values.

Once the underlying asset class has been selected, the attributes associated to the underlying asset class will be displayed after. The underlying structure and underlier type behavior will vary depending on the asset class selected by the user.

Rates	Properties
Notional Currency	EUR
Other Notional Currency	EUR
Return or Payout Trigger	Spreadbets
Underlying Structure	Single Underlier
Underlier ID	AUD-CPI
Underlier ID Source	FPML
Reference Rate Term Value	0
Reference Rate Term Unit	DAYS

Foreign_Exchange	Properties
Underlier ID Source	CCY
Underlier ID	EUR
Other Underlier ID Source	CCY
Other Underlier ID	EUR
Return or Payout Trigger	Spreadbets
Settlement Currency	EUR
Place of Settlement	Afghanistan

7.2 Underlying Structure behavior

The Underlying Structure defines whether a product has single underlier or multiple underliers. The structure will vary depending on the product usage.

In the sample below for Non-standard Credit where Underlying structure is a dropdown in request template. The user is allowed to define whether underlying is a single or a basket (multiple underliers).

If single underlier is selected, the associated attributes of the underlying will be displayed which includes the underlier source and identifier, then the record will return the input underlying details and underlier characteristic of a “Single” in the Attribute section.

Request

A screenshot of a 'Properties' tab in a request form. The form contains several dropdown menus and text input fields. At the top, there is a 'Properties' button. Below it, the 'Underlying Structure' dropdown is set to 'Single Underlier'. The 'Underlying Asset Type' dropdown is set to 'Other'. The 'Underlier Type' dropdown is set to 'Fixed Income Security'. Below these are three fields: 'Underlier ID Source' with a dropdown set to 'ISIN', 'Underlier ID' with the text 'TH3871A33400', and 'Debt Seniority' with a dropdown set to 'Senior Debt'.

Record

The screenshot shows a form with two main sections: 'Attributes' and 'Underlying'. In the 'Attributes' section, there is a field for 'Underlying Asset Type' with the value 'Other'. In the 'Underlying' section, there are two fields: 'Underlier Characteristic' with the value 'Single' (highlighted by an orange border) and 'Underlying Instrument ISIN' with the value 'TH3871A33400'.

If Basket is selected, the associated underlier/s of the product is not required to identify and the underlier characteristic of a “Basket” is default in the request message. The record will return underlier characteristic in the Attribute section.

Request

The screenshot shows a form with a 'Properties' button and a dropdown menu for 'Underlying Structure' set to 'Basket'.

Record

The screenshot shows a form with two main sections: 'Attributes' and 'Underlying'. In the 'Attributes' section, there is a field for 'Underlying Asset Type' with the value 'Other'. In the 'Underlying' section, there is a field for 'Underlier Characteristic' with the value 'Basket' (highlighted by an orange border).

In cases where the underlying is already defined based on the nature of its product e.g., OIS rates swap (only single underlying is required), the underlying structure will not be a requirement in the request message.

- a. Sample below is OIS rates swap where the underlier must only be one, the underlying structure is not visible in the request or record template, however, the identifier and its source are required to be populated in the request.

Attributes
✎ Properties

Notional Currency	EUR	▼
Underlier ID	AED-EBOR-Reuters (2006)	▼
Underlier ID Source	FPML	▼
Reference Rate Term Value	0	
Reference Rate Term Unit	DAYS	▼
Notional Schedule	Constant	▼
Delivery Type	Physical	▼

- b. In cases like Multi exotic commodities swap where the underlying is multiple and cannot be single underlier. The structure will be treated as Basket and will be defined in the Derived section of the record template. The underliers associated to the product will not be a requirement in the request and record templates.

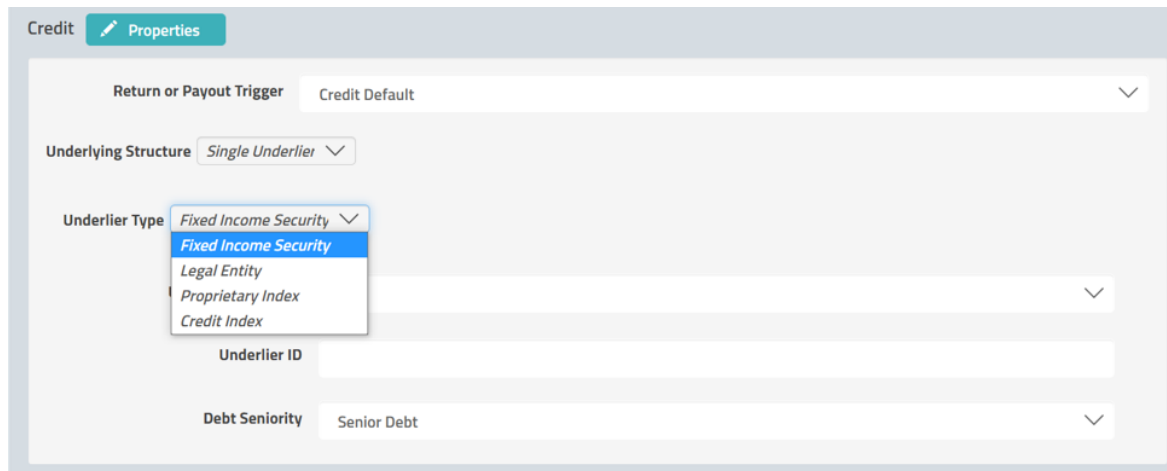

Derived

Classification Type	STACXC
Short Name	NA/Swap AGRI
Underlier Name	Basket
Underlier Characteristic	Basket
Underlying Asset Type	Agriculture
CFI Delivery Type	Cash

7.3 Underlier Type

The selection supports the type of underlier whether it has single or multiple underlier types. The Underlier type will vary depending on the nature of the product e.g., for Equity – Security, Index and Prop Index are the supported underlier types whilst in Credit – Fixed Income Security, Legal Entity, Credit Index and Prop Index are the supported underlier types.

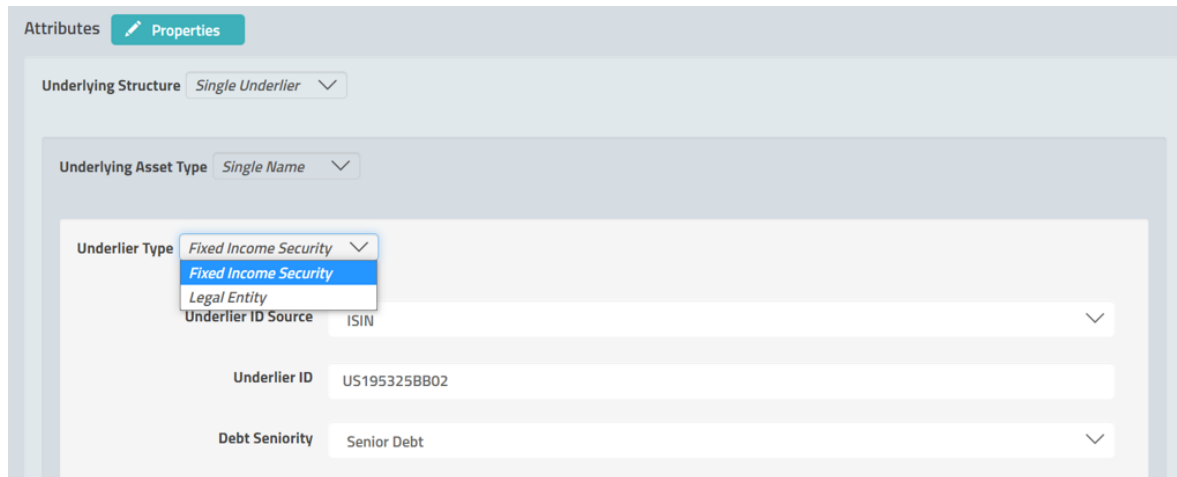

In the sample below for Non-standard Credit where user selects “Single Underlier” as underlying structure, the underlier type will have a selection of values depending on the user’s requirement.

The screenshot displays a form titled "Credit" with a "Properties" tab. The form contains several fields:

- Return or Payout Trigger:** A dropdown menu currently set to "Credit Default".
- Underlying Structure:** A dropdown menu currently set to "Single Underlier".
- Underlier Type:** A dropdown menu with a list of options: "Fixed Income Security" (highlighted in blue), "Legal Entity", "Proprietary Index", and "Credit Index".
- Underlier ID:** An empty text input field.
- Debt Seniority:** A dropdown menu currently set to "Senior Debt".

If the underlier type selected is Fixed Income Security, the identifier and source associated to underlier type will be displayed.

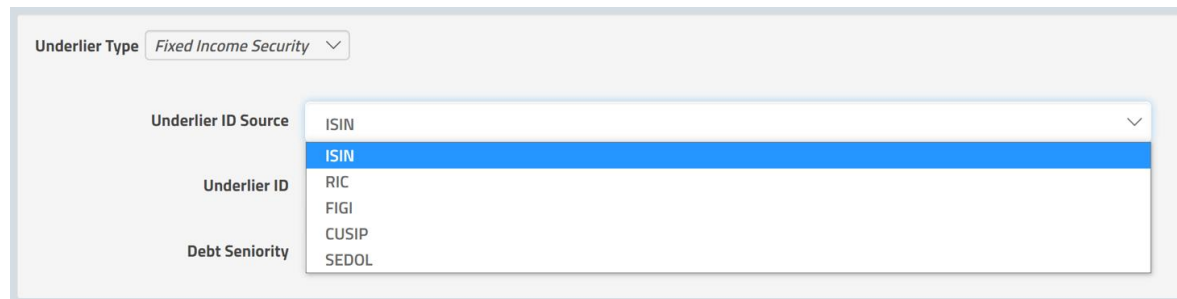

The screenshot shows a form titled "Attributes" with a "Properties" tab. The form contains several dropdown menus and text input fields. The "Underlying Structure" dropdown is set to "Single Underlier". The "Underlying Asset Type" dropdown is set to "Single Name". The "Underlier Type" dropdown is open, showing two options: "Fixed Income Security" (selected) and "Legal Entity". Below the dropdown, the "Underlier ID Source" is set to "ISIN". The "Underlier ID" field contains the value "US195325BB02". The "Debt Seniority" dropdown is set to "Senior Debt".

7.4 Underlier ID Source

The selection supports the origin of the underlier ID. In cases where (a) single underlier ID source is supported, the field will have a default value or (b) if multiple underlier ID Source is available, an enumeration list will be available based on its supported product.

For sample Non-standard Credit where underlier type – Fixed Income Security can be supported by different sources e.g., ISIN, RIC, FIGI, CUSIP and SEDOL. The selection of values will be available in the dropdown after selecting the Fixed Income Security as underlier type.

The screenshot shows a form titled "Underlier Type" with a dropdown menu set to "Fixed Income Security". Below this, the "Underlier ID Source" dropdown is open, showing a list of options: "ISIN" (selected), "RIC", "FIGI", "CUSIP", and "SEDOL". The "Underlier ID" and "Debt Seniority" fields are visible but not selected.

In case the supported source has only one value, the selection is not required, and the value for underlier ID source is auto populated.

The screenshot shows a form with the following fields and values:

- Underlier Type:** Legal Entity (dropdown menu)
- Underlier ID Source:** LEI (dropdown menu, with a blue highlight on the selected value)
- Underlier ID:** (empty text input field)
- Debt Seniority:** Senior Debt (dropdown menu)

8 APPENDIX

The table below illustrates the underlier structure selection, underlier type and their sources per product templates.
